

## HYCZ-5 SERIES WHEEL TRACKING APPARATUS

The wheel tracking apparatus is used to determine the high temperature rutting resistance of asphalt mixtures, to evaluate the deformation resistance to the permanent deformation of a bituminous test. This test is subjected to continue movement of a wheel, that applies the load in an environment with controlled and constant temperature. It can be used for auxiliary inspection of asphalt mixture ratio design, and can also be used for high temperature stability inspection of asphalt mixture on site.

## **FEATURES**

- It can be used as water immersion test.
- $\odot$  Displacement sensor with high precision, accuracy is less than  $\pm$  0.01 mm.
- Multi-point acquisition is adopted, high resolution and high speed.
- $\odot$  Cylinder loading, pressure adjustment is convenient. Adjustable pressure range: 0.5mpa  $\sim$  1.4mpa.
- O Computer control, easy to operate.
- Real-time pressure can be displayed. Automatic temperature control, automatic generation and storage of test results.
- The temperature is collected with an absolute temperature sensor, with wide temperature control range, high precision and good stability.
- PWM modulation method is adopted to improve the temperature PID control, to ensure that the temperature without overshoot.
- O Air circulation and stirring system are adopted to control temperature more evenly.
- O The test process can be stopped by time or times. (optional)
